NAL

(noch auf englisch)

NAL (Netware Application Launcher) gives network administrators the option of "pulling" or "pushing" software to desktops. **Pull distribution** lets you surface an application icon on the user"s desktop. Clicking the icon launches an application (which resides on a server) or runs an install program, placing the application on the user"s hard drive before launching it. **Push distribution** loads applications onto target desktops without user intervention. This helps in distributing software that needs to reside on desktops, like an operating system or network client updates, as well as e- mail and custom business applications. (Server-to-server software distribution will be available in the future.)

[Novell AppNotes 8/97]

Diese Information gilt für Version 2.0. Aktuell ist die Version 2.5.
